

Digital Tables

– the next generation!

Digital tables can be used for many different purposes, connected either to a local server or to the Internet. Prototypes have been developed and built in several different versions and the tables in the market today are the third generation of digital tables. The housing, as well as the software that runs on the computers, can be branded according to the buyers requirements. ConnectedTable can also provide software that supports different use of the tables.

The computer hardware is custom-made and configured to Connected Table's specifications. Since the computers are used in a high-end product, designed for public environments, the demands on the hardware are severe. The tables are equipped

with crystal clear touchscreens with 170 degrees viewing angle. All hardware is IP-65 classified, which guarantees the highest protection against fluids and dust. The tables are equipped with RFID card readers for account verification.

The tables can be ordered in a variety of sizes and designs and used in many different ways. They work well as gaming devices for server based games (Poker, Casino, Bingo etc) and are excellent tools for information, entertainment and advertising.

Connected Table offers an account based solution for Poker and Casino that has been tailor made for the digital tables. Please ask us for more information about the software!
